

Wintertime is time for winter diseases

Optibelt recommends the replacement of belts and tensioners

Especially during wintertime drive belts and tensioners are subject to adverse weather conditions. In these wintry days, surely every car driver is acquainted with the characteristic squeaking and screeching sounds emerging from the engine bay in the morning. These are first but definite indications for a malfunctioning belt system. Due to the chill the belts lose grip and thus they begin to slip. In case you notice this first evidence, we recommend you to go to a specialised garage and see an expert about checking the belts and tensioners.

You should always avoid driving on with squealing belts. The mechanics in the respective garage are skilled in installing new belts. However, it is important to make sure that the tensioner is also checked, and if necessary, replaced.

Prepare yourself in sufficient time to get your belts and tensioners thoroughly examined by skilled experts. Put your trust in Optibelt CarPOWER drive belts in OE quality. With us you can be sure to definitely reach your destination!
